

NOW WITH ENHANCED FUNCTIONALITY

A new enhanced version of MERLIN® III Visual Design Software is now available for the Telesis TMP6100/470 system. Unlike the previous version, which required the PC to stay connected to a single TMC470 controller, version 2.x allows patterns created in MERLIN III (remotely or interactively) to be downloaded via Ethernet utilizing TCP/IP protocol to the TMC470 controller.

Once the pattern and any support files required (eg. blocks, fonts) are downloaded to the controller, the PC can be disconnected from the TMC470 for standalone operation.

This powerful enhancement is in addition to other features of the MERLIN III software that went beyond those of MERLIN II, including:

- The ability to color code field types; for example all Arc Text fields can be displayed in red in both the visual and list views.
- The ability to assign specific names to fields. For instance, a specific text field can be labeled "Part Number" in the list view so the operator easily knows into which variable text field to enter the part number.
- The ability to mark QR and MicroQR codes, types of 2D codes prevalent particularly in Japan.

The 470 Controller is also available for other pinstamp models and available for upgrading to your system.
